Tools

Coding is amazing because it doesn't require too much software and the software it does require is free. It ends up being a matter of preference to what code editor you use.

Software & Services

www.code.visualstudio.com

The industry standard code editing tool

FTP Services

Filezilla
Cyberduck
Transmit

These services enable you to log into servers where your code may live.

www.github.com

When you code projects, it's best practice to track your code changes. So later on if there is a bug you can find it. It essentially gives you a save point for your code.

The other gain is it enables you to work on code with others. This gives you the ability to merge code together and have others review your code before pushing it live into larger projects.

www.netlify.com

This is a great service for hosting static sites for free. Sites that are static often use a headless CMS, something you will learn about if you explore React.
